

Act Report

These are the insights and visualizations that I came up with from the final data set after wrangling, hopefully it will be useful for the account manger of we love dogs to gain more interactions or as stepping stone to make an automatic bot the tweets the cutest dogs there is to maximize interactions with the account.

After the top 10 breeds by number of favorites (likes) it turns out that the Saluki is most liked one.

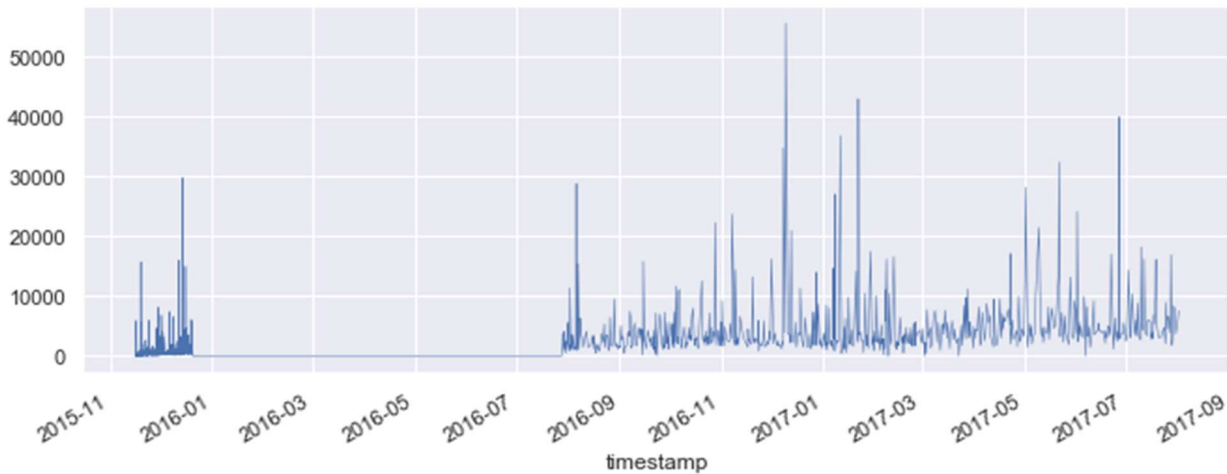

The fig. below shows that different age groups of dogs the number of interactions and this reflects that dogs in the puppo= puppy phase are the most adorable as doggo-puppo & puppo has the highest interactions and they both represent this age group.

After performing Time series analysis on the interactions with the we love dog account I came up with hypotheses that prior to the trend of **(They're Good Dogs Brent)** on Feb. 2017 they had the most retweets which made the noticeable and then after being famous because of this trend they got to the peak of there likes in this period as a result of being famous , then it had a dramatic decrees in the number of retweets but somehow the exiting flowers maintained interacting with the page through liking the there tweets
